

Rasterization Pipeline & WebGL I Journal

Elina Adibi

(60%) Concepts & Application (2-3 paragraphs)

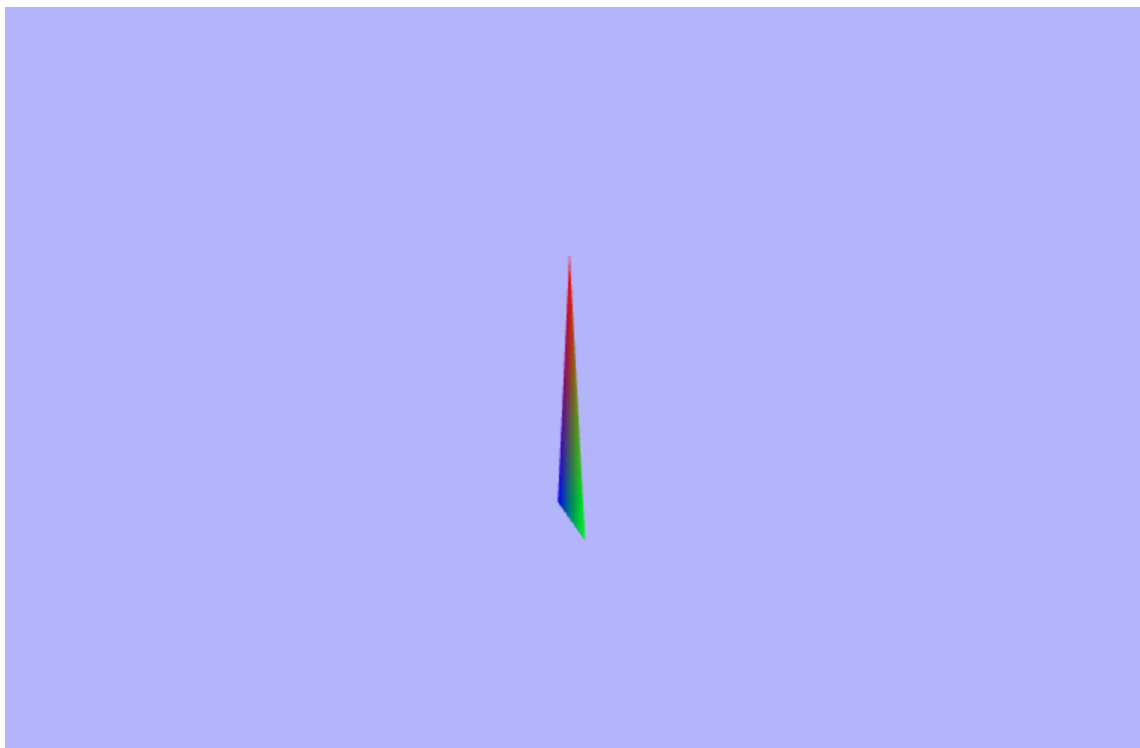

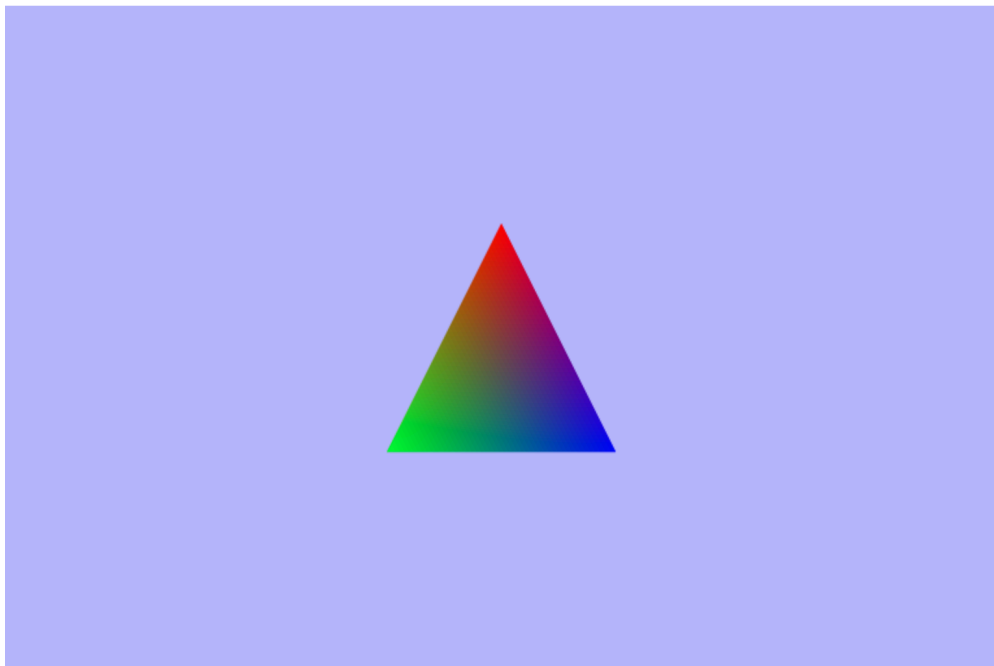

As I've been diving into the world of rasterization pipelines and WebGL, I've come across some pretty fascinating stuff that's helping me see how graphics really work. One thing that's really stuck with me is how we represent shapes—polygon meshes are like the building blocks that make up everything we see on screen. It's sort of like connecting the dots to create a picture, but in a digital world.

As I keep exploring, I'm starting to realize just how important it is to understand how objects move and interact in different spaces. It's like organizing a collection of puzzle pieces—each placement has to be just right to complete the picture effectively. From an object's own space to the whole scene, every change adds something new to the story we're making.

I can't wait to dive into the next phase of the process: rasterization. It's where the real magic happens as those shapes we've been working with start to become pixels on the screen. But I know it won't be all smooth sailing :) Still, I'm excited to tackle these challenges head-on and really get to grips with how we bring graphics to life.

(20%) Support Utilization

- (5%) How effectively did you and your partner work as a team?
My partner and I worked well together during the module. We talked a lot and helped each other understand this week's material and solve homework together.
- (5%) Did you attend office hours or seek help from the TA or professor?
Unfortunately, I could not attend office hours this week.
- (10%) Submit a link to your most useful **shared** conversation with the [course GPT](#). This conversation should demonstrate how you used AI to further your understanding of the concepts, troubleshoot issues, or explore new ideas. Do not delete this conversation or the link will break.
